main.py

Visualize Run

```python
# Customer data
customers = [
    [20, 20, 1, 1],
    [25, 30, 2, 1],
    [30, 40, 3, 1],
    [35, 50, 4, 0],
    [40, 60, 5, 0],
    [45, 70, 6, 0],
    [50, 80, 7, 0],
    [55, 90, 8, 0]
]

print("CUSTOMER CHURN PREDICTION")
print("------------------------")

# Display data
print("Age  Charges  Tenure  Churn")

for customer in customers:
    print(customer[0], "  ", customer[1], "     ", customer[2], "     ",
```

Output

```
CUSTOMER CHURN PREDICTION
------------------------
Age  Charges  Tenure  Churn
20    20       1       1
25    30       2       1
30    40       3       1
35    50       4       0
40    60       5       0
45    70       6       0
50    80       7       0
55    90       8       0

New Customer:
Age: 27
Monthly Charges: 35
Tenure: 2
Prediction: Customer is likely to CHURN

=== Code Execution Successful ===
```

```python
for customer in customers:
    customer[3])

# Predict a new customer
age = 27
charges = 35
tenure = 2

# Simple prediction rule
if tenure <= 3 and charges <= 40:
    prediction = 1
else:
    prediction = 0

print("\nNew Customer:")
print("Age:", age)
print("Monthly Charges:", charges)
print("Tenure:", tenure)

if prediction == 1:
    print("Prediction: Customer is likely to CHURN")
```

```
CUSTOMER CHURN PREDICTION
-------------------------
Age  Charges  Tenure  Churn
20    20        1       1
25    30        2       1
